# The Triple Threat Protection

## **Sendmarc** **The Email Authority**

Email is the #1 vector for cyberattacks.

Sendmarc ensures that your domain can never be used for phishing or spoofing, protecting your reputation and your customers.

DMARC Enforcement: Stops unauthorized users from sending emails on your behalf.

Brand Protection: Increases email deliverability by proving to global mail servers that your communications are legitimate.

Visibility: Get a crystal-clear view of every service using your domain across the globe.

## **Sophos** **The Managed Shield**

Once inside a network, threats move fast.

Sophos provides AI-driven protection that detects and remediates malware and ransomware before they can execute.

Intercept X: The world's best endpoint protection, using deep learning to stop "never-before-seen" malware.

Synchronized Security: Your firewall and endpoints "talk" to each other. If an infection is detected, the network automatically isolates the compromised device.

Managed Detection & Response (MDR): 24/7 threat hunting by elite experts to stop breaches before they start.

## **Cloudflare** **The Global Perimeter**

Cloudflare acts as a global shield for your website, APIs, and remote workforce, ensuring everything is fast, private, and secure.

Zero Trust Architecture: Replace clunky VPNs. Ensure that only authenticated users —on healthy devices—can access your sensitive internal apps.

DDoS Mitigation: Keep your digital presence online even during the most massive attacks.

WAF (Web Application Firewall): Blocks malicious web traffic and exploits like SQL injection and cross-site scripting.
